**Abstract:** The increasing emphasis on energy conservation and environmental protection has led to investigation of alternatives to customary building material. Effort are urgently underway all over the world to develop environment friendly construction materials which makes minimum utility of natural resources and helps to reduce green house gas emission Geopolymer concrete (GPC) is one of the most recently developed structural concretes, where industrial wastes like fly ash, rice husk, ground granulated blast furnace slag (GGBS) are utilized for complete replacement of ordinary Portland cement in concrete. A major contribution to structural concrete in the form of Geopolymer concrete was developed by many investigators with lesser grade of concrete. The contribution of green house gas emission due to ordinary Portland cement production worldwide is approximately 7%. For each ton of Portland cement manufactures, it is estimated that one ton of CO<sub>2</sub> is released into the environment. In this connection, Geopolymer are showing great potential and does not need the presence of Portland cement as binder. Geopolymer concrete is prepared by using alkaline solution of suitable chemical composition. The ratio of mixture is 2.5 and the concentration of sodium hydroxide is 10M. The geo polymer concrete specimens are casted and tested for different types of strengths for 3, 7, and 28 days and cured at ambient temperature.

**Keywords:** Geo-polymer, Metakaolin, Ground Granulated Blast Furnace Slag, Alkali Activator.

---

### I. Introduction

Geopolymer Concrete (GPC) is an efficient binder in the manufacturing of concrete technology. The source materials such as Metakaolin are treated with alkaline liquid to obtain the binder/adhesive agent. Geopolymer concrete will be introduced as an alternative concrete which did not use any cement in its mixture and used GGBS and Metakaolin as alternative cement. NaOH and Na<sub>2</sub>SiO<sub>3</sub> were used as activator solution. Geopolymer cement is a state of art novelty and tend to create a platform for substitution with conventional manufacturing materials for architectural and construction industry. The concrete technology should tune on the lines of sustainability where the materials utilized in construction sector should be eco-friendly as well as facilitate the process of reuse if necessary. The integrated ecological based waste utilization finds its application ranging from small scale industries to large Power plants, etc. As a part of this novel idea, materials such as slag can be transformed in to geopolymer concrete or nowadays called as green concrete. Concrete is predominantly used material in architectural and construction industry<sup>1</sup> The overall global production of cement is 2.8 billion tones according.<sup>2</sup> A recent report to the United Nations Industrial Development Organization highlighted that as of 2005, 60% of China's cement production was from Vertical Shaft Kilns (VSKs); characterized by low production efficiency<sup>3</sup>. The VSKs generally produced low quality cement unsuitable for large structures, infrastructure, or export. The emission of CO<sub>2</sub> in the production of cement is due to clinker production, combustion of fuels in the cement kilns, and the use of energy for grinding raw material and clinker<sup>4-13</sup>. Abundant research has been conducted on newer concrete technologies and their use is seen in many construction solutions as they provide viable means of reducing the carbon footprint of concrete.<sup>5</sup> the use of greener concrete is increasing day by day. A recent post-tensioned structure had concrete with 50% replacement of cement by slag for the slabs, columns, and walls; and 70% replacement in the mat foundation, resulting in an estimated reduction on carbon dioxide emissions for the project of 4500 tones (4400 tons). The latest research into the green concrete properties and it is extensive. Researchers have examined the durability and mechanical properties of concrete with fully replacement of cement by pozzolanic material.<sup>7, 8</sup> High volume substitutions for cement replacement results high strength and high durability concrete.<sup>9-18</sup> the covalent bond between the oligomers tends to form a network and this process of combination results in what is known as geopolymerization. Refer Figure 1 shows the mixture of new product.

## II. Materials Used

### 2.1 Met kaolin

Metakaolin is one of the Pozzolanic materials used in concrete as a binder replaced by cement. It is suggested that firing kaolinite at lower temperatures (< 500 °C) does not give sufficient energy to break the crystalline structure of kaolinite. Refer Figure 2, 3, 4 and Table 1, 2

**Table-1:** Properties of Metakaolin

| Property         | Value                  |
|------------------|------------------------|
| Specific Surface | 9-16 m <sup>2</sup> /g |
| Physical Form    | Powder                 |
| Specific Gravity | 2.50                   |
| Color            | Baby Pink              |

**Table-2:** Chemical Composition of metakaolin

| Oxide                          | %       |
|--------------------------------|---------|
| Al <sub>2</sub> O <sub>3</sub> | 42-44%  |
| SiO <sub>2</sub>               | 51-53%  |
| TiO <sub>2</sub>               | <3.01%  |
| Fe <sub>2</sub> O <sub>3</sub> | <2.21%  |
| SO <sub>4</sub>                | <0.51%  |
| CaO                            | <0.22%  |
| MgO                            | <0.11%  |
| K <sub>2</sub> O               | <0.43%  |
| L.O.I                          | <0.51%  |
| Na <sub>2</sub> O              | <0.053% |

**Figure 4:** Metakaolin

### 2.2 Ground Granulated Blast Furnace Slag:

Ground Granulated Blast Furnace Slag (GGBS) is synthesized through the process of quenching. It is amorphous in nature and formed as a result of slag quenching from blast furnace. It can be seen as auxiliary product during production of steel which can aid in concrete technology. Refer Figure 5, 6 and Table 3, 4

**Table 3:** Properties of Ground Granulated Blast Furnace Slag

| Property                | Value                             |
|-------------------------|-----------------------------------|
| Relative density        | 2.85–2.95                         |
| Bulk density (loose)    | 1.0–1.1 tonnes/m <sup>3</sup>     |
| Surface area            | 400–600 m <sup>2</sup> /kg Blaine |
| Bulk density (vibrated) | 1.2–1.3 tonnes/m <sup>3</sup>     |
| Colour                  | Off-white powder                  |

**Table-4:** Chemical Composition of Ground Granulated Blast Furnace Slag

| Oxide                          | %     |
|--------------------------------|-------|
| CaO                            | 36.77 |
| SiO <sub>2</sub>               | 30.97 |
| Al <sub>2</sub> O <sub>3</sub> | 17.41 |
| MgO                            | 9.01  |
| SO <sub>3</sub>                | 1.82  |
| Fe <sub>2</sub> O <sub>3</sub> | 1.03  |
| Na <sub>2</sub> O              | 0.69  |
| K <sub>2</sub> O               | 0.46  |

Figure 6: Ground Granulated Blast Furnace Slag

**2.3 Coarse Aggregate:**

Coarse aggregates of sizes 10mm and 20mm are taken. Refer Figure 7 and Table 5.

**Table-5:** I.S. Sieve specifications of Coarse Aggregate

| IS Sieve No (mm)                  | 20 mm                           |                    | 10mm                            |                    |

| Fineness modulus | 3.12                   |                        |
| Specific Gravity | 2.78                   |                        |
| Bulk Density     | 1375 Kg/m <sup>3</sup> |                        |

Figure 8: Fine Aggregate

### 2.5 Sodium Hydroxide:

Sodium Hydroxide is the alkaline activator used in the process of geopolymerisation whose chemical properties are given in Refer Figure 9, 10 and Table 7.

**Table 7: Properties of Sodium Hydroxide**

| Property            | Value  |
|---------------------|--|
| Appearance          | White  |
| Boiling point       | 1,389°C  |
| Chemical formula    | NaOH   |
| Solubility in water | 419 g/L (0°C)<br>1111 g/L (20°C)<br>3371 g/L (100°C) |
| Molar mass          | 40 g mol <sup>-1</sup>                               |
| Odor                | Odorless   |
| Melting point       | 318°C  |
| Density             | 2.14 g/cm <sup>3</sup>                               |

**Figure 9: Sodium Hydroxide Flakes**

**Figure 10: Sodium Hydroxide Solution**

### 2.6 SODIUM SILICATE (Na<sub>2</sub>SiO<sub>3</sub>):

Sodium Silicate is the common name for compounds with the formula Na<sub>2</sub>(SiO<sub>2</sub>)<sub>n</sub>O. Refer Figure 11, 12, 13 and Table 8.

**Figure 11: Solution of Sodium Silicate**

**Figure 12: Sodium Silicate Structure**

Figure 13: 3-D Structure of sodium silicate

Table-8: Properties of Sodium Silicate

| Property                   | Value   |
|----------------------------|---|
| Solubility in water        | 22.2 g/100 ml (25°C)<br>160.6 g/100 ml (80°C) |
| Refractive index ( $n_D$ ) | 1.52  |
| Appearance                 | White to greenish                             |
| Chemical formula           | $\text{Na}_2\text{SiO}_3$                     |
| Density                    | $2.62 \text{ g cm}^{-3}$                      |
| Melting point              | $1,089 \text{ }^\circ\text{C}$                |
| Solubility                 | insoluble in alcohol                          |

**2.7 Sodium Sulfate ( $\text{Na}_2\text{SO}_4$ ):**

Sodium sulfate is the inorganic compound with formula  $\text{Na}_2\text{SO}_4$  is used in the process of green concrete technology. Refer Figure 13, 14 and Table 9.

Figure 14: Sodium sulfate

Figure 15: Sodium Sulphate structure

Table-9: Durability Parameters

| S. no | Parameters to study            | Volume of Specimen in mm | Chemical for curing | No of specimens |
|-------|--------------------------------|--------------------------|---------------------|-----------------|
| 1     | Change in compressive strength | 150X150X150              | Sodium Sulphate     | 9               |
| 2     | Change in mass                 | 150X150X150              | Sodium Sulphate     | 9               |

**III. Methodology**

**3.1 Geopolymer Concrete MIX:**

Initially dry mix, fine as well as coarse aggregate, alkaline solution and Pozzolanic material (Metakaolin + GGBS) are combined. About 6 to 8 minutes spent for mixing of concrete to achieve proper bonding of materials. Later, mixing Cubes, beams, cylinders with sizes 150mm X 150mm X 150mm, 500mm X 100mm X 100mm, and 150mm dia 300mm height are casted and compacted properly. In this project ambient curing is chosen for curing of geo-polymer concrete. For ambient curing, cubes are un-moulded after 24 hours of casting and they are placed in the direct sunlight for 72 hours. Refer Table 10, 11, 12.

**Table 10:** Mixing Proportion of Geopolymer concrete

| Ingredients in (kg/m <sup>3</sup> )  |       | Different mixes |                |                |                |                |                |
|--------------------------------------|-------|-----------------|----------------|----------------|----------------|----------------|----------------|
|                                      |       | C <sub>1</sub>  | C <sub>2</sub> | C <sub>3</sub> | C <sub>4</sub> | C <sub>5</sub> | C <sub>6</sub> |
| Pozzolanic Material                  |       | 414             | 414            | 414            | 414            | 414            | 414            |

**STRENGTH:**

The experimental investigation processed by taking six pozzolanic Proportions pictured in above table in the aspects of Compressive, Split Tensile, and Flexural strengths where proportions starts from 50% Metakaolin + 50% GGBS to 100% Metakaolin.

**Table-11:** Mix ID of Pozzolanic Material Proportions for Strength properties

| Mix ID         | Metakaolin (%) | Ground Granulated Blast Furnace Slag (%) |
|----------------|----------------|--|
| C <sub>1</sub> | 50             | 50                                       |
| C <sub>2</sub> | 60             | 40                                       |
| C <sub>3</sub> | 70             | 30                                       |
| C <sub>4</sub> | 80             | 20                                       |
| C <sub>5</sub> | 90             | 10                                       |
| C <sub>6</sub> | 100            | 0  |

**Durability:**

The experimental investigation Processed by taking 3 Pozzolanic Proportions C<sub>1</sub>, C<sub>3</sub>, C<sub>6</sub> pictured in above table in the aspects of Durability

**Table-12:** Mix ID of Pozzolanic Material Proportions for Durability Properties

| Mix ID         | Metakaolin (%) | Ground Granulated Blast Furnace Slag (%) |
|----------------|----------------|--|
| C <sub>1</sub> | 50             | 50                                       |
| C <sub>3</sub> | 70             | 30                                       |
| C <sub>6</sub> | 100            | 0  |

**IV. Results & Discussions**

The cubes, beams, cylinder specimens have undergone the process of testing using standard equipment to determine compressive, flexural and split tensile strengths at the age of 3, 7, and 28 days. The figures 5, 6 and 7 are showing the graphical and table 13, 15, 16 shows tabular representation of various strengths with 10 Molarity alkali activator for the specimens which were cured in sunlight.

**4.1 Compressive Strength:**

The compressive strength of concrete with different proportions are casted of age 3, 7 and 28 days and a graph is plotted between pozzolanic material proportion(x-axis) Vs compressive strength (y-axis).From the figure we can say, as the age of concrete increases compressive strength increases. 100% Metakaolin gives compressive strength of 60.03 N/mm<sup>2</sup> which is the maximum strength obtained than other proportions. The strength variation between one proportion to other and one age to other is in slight manner. Refer Figure 16, 17 and Table 13

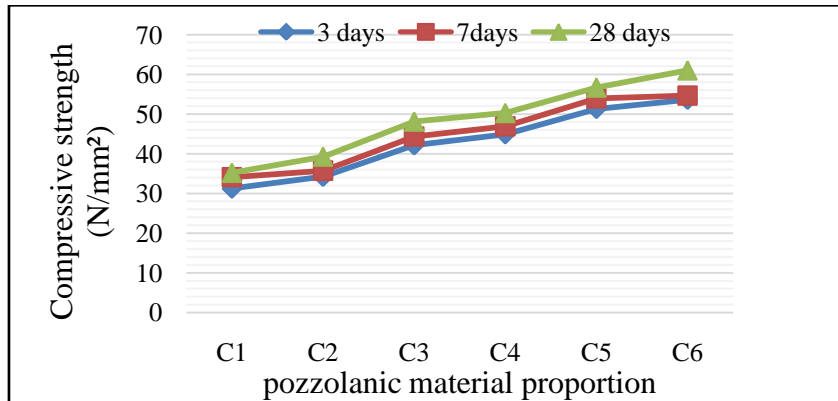

**Figure 16:** Compression test of Geopolymer concrete

**Table-13:** Compressive Strength of Geopolymer concrete

| Mix ID | POZZOLANIC MATERIAL PROPORTION |          | COMPRESSIVE STRENGTH (N/mm <sup>2</sup> ) |        |         |
|--------|--------------------------------|----------|---|--------|---------|
|        | Metakaolin (%)                 | GGBS (%) | 3 DAYS                                    | 7 DAYS | 28 DAYS |
| C1     | 50                             | 50       | 31.23                                     | 34.12  | 35.23   |
| C2     | 60                             | 40       | 34.20                                     | 35.72  | 39.29   |
| C3     | 70                             | 30       | 42.14                                     | 44.32  | 48.13   |
| C4     | 80                             | 20       | 44.91                                     | 46.94  | 50.28   |
| C5     | 90                             | 10       | 51.3                                      | 53.91  | 56.71   |
| C6     | 100                            | 0        | 53.62                                     | 54.64  | 61.03   |

**Figure 17:** Graph between Compressive Strength and Pozzolanic Material Proportions

**4.2 Split Tensile Strength:**

The Split Tensile Strength of GPC with different proportions are obtained of age 3, 7 and 28 and a graph is plotted between pozzolanic material proportion (x-axis) vs split tensile strength (y-axis). From the figure we can say, as the age of concrete increases tensile strength increases. 100% Metakaolin gives strength of 6.73 N/mm<sup>2</sup> which is the maximum strength obtained than other proportions. The strength variation between one proportion to other and one age to other is in slight manner. Refer Figure 18, 19 and Table 14

**Table-14:** Split Tensile Strength of Geopolymer Concrete

| Proportion | POZZOLANIC MATERIAL |          | SPLIT TENSILE STRENGTH (N/mm <sup>2</sup> ) |        |         |
|------------|---------------------|----------|---|--------|---------|
|            | Metakaolin (%)      | GGBS (%) | 3 DAYS                                      | 7 DAYS | 28 DAYS |
| C1         | 50                  | 50       | 3.12  | 3.72   | 3.9     |
| C2         | 60                  | 40       | 3.70  | 3.81   | 4.14    |
| C3         | 70                  | 30       | 3.92  | 3.98   | 4.23    |
| C4         | 80                  | 20       | 4.21  | 4.65   | 4.71    |
| C5         | 90                  | 10       | 5.26  | 5.87   | 5.81    |
| C6         | 100                 | 0        | 6.22  | 6.53   | 6.73    |

**Figure 18:** Split Tensile Test of Geopolymer concrete

Figure 19: Graph between Split tensile Strength and Pozzolanic Material Proportions

**4.3 Flexural Strength:**

The Flexural strength of concrete with different proportions are evaluated of age 3, 7 and 28 days and a graph is plotted between pozzolanic material proportion (x-axis) vs Flexural strength (y-axis). A two point load is applied on the beams of size 50mm in length, 10mm in width and 10mm in depth. From the figure we can say, as the age of concrete increases Flexural strength increases. 100% Metakaolin gives Flexural strength of 3.54 N/mm<sup>2</sup> which is the maximum strength obtained than other proportions. The strength variation of C1, C2, C3 and C4 are slight but C5, C6 has vast variation. Refer Figure 20 and Table 15

**Table-15:** Flexural Strength of Geopolymer concrete

| Proportion | POZZOLANIC MATERIAL |          | FLEXURAL STRENGTH (N/mm <sup>2</sup> ) |        |         |
|------------|---------------------|----------|--|--------|---------|
|            | Metakaolin (%)      | GGBS (%) | 3 DAYS                                 | 7 DAYS | 28 DAYS |
| C1         | 50                  | 50       | 0.75                                   | 0.822  | 0.87    |
| C2         | 60                  | 40       | 0.85                                   | 0.9    | 1.2     |
| C3         | 70                  | 30       | 1.11                                   | 1.58   | 1.75    |
| C4         | 80                  | 20       | 1.63                                   | 1.67   | 1.71    |
| C5         | 90                  | 10       | 1.96                                   | 2.57   | 2.81    |
| C6         | 100                 | 0        | 3.2                                    | 3.41   | 3.54    |

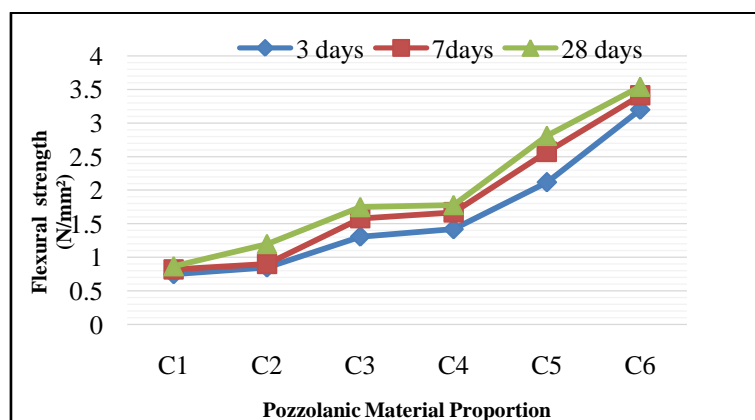

Figure 20: Graph between Flexural Strength and Pozzolanic Material Proportions

**Durability:**

Durability is a major factor to be considered for the structure to with stand for a long period i.e. the age of the structure should be more durable. So my experimental investigation take me to identify the structural behavior on different environmental like Chloride attack, Acid attack and Sulphate attack. But in this report work is concentrated on sulphate attack. Therefore the results and discussions are processed as follows. Refer Figure 21, 22, 23 and Table 16, 17

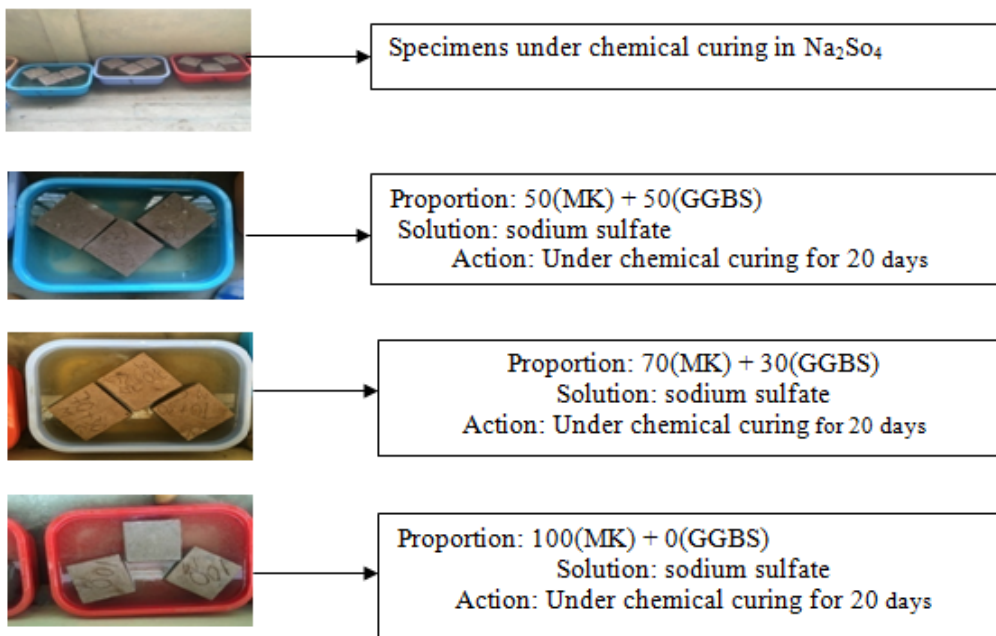

- The **initial** compressive strengths are obtained from the proportions C1, C3, C6 which are in ambient curing for 28 days.
- The **final** compressive strengths are obtained from the proportions C1, C3, C6 which are in chemical curing for 30 days and dried for 15 day

**Table-16:** Percentage Reduction in weight

| S.no | Mix ID         | Weight of Specimens (grams) |       | Reduction in weight (grams) | % Reduction in weight | No. of days |
|------|----------------|-----------------------------|-------|-----------------------------|-----------------------|-------------|
|      |                | Initial                     | Final |                             |                       |             |
| 1    | C <sub>1</sub> | 8193                        | 8133  | 60                          | 0.73                  | 20          |
| 2    | C <sub>3</sub> | 8856                        | 8795  | 61                          | 0.68                  | 20          |

**Figure 21:** Graph between Pozzolanic Material and % Weight Reduction

**Table-17:** Compressive strength of Geopolymer Concrete after exposure to sulfate solution

| S.no | MIX ID         | Compressive strength (N/mm <sup>2</sup> ) |       | % Reduction in C.S | No. of days for chemical curing |
|------|----------------|---|-------|--------------------|---------------------------------|
|      |                | Initial                                   | Final |                    |                                 |
| 1    | C <sub>1</sub> | 35.23                                     | 31.09 | 11.75              | 20                              |
| 2    | C <sub>3</sub> | 48.13                                     | 43.88 | 8.83               | 20                              |
| 3    | C <sub>6</sub> | 61.03                                     | 51.70 | 15.28              | 20                              |

Figure 23: Graph between Pozzolanic proportion and % Reduction in Compressive strength.

## V. Conclusion

- From the above results it is apparent that Geopolymer concrete based on GGBS and metakaolin has got more compressive strength than conventional concrete.
- It is observed that the Compressive, Flexural and Split Tensile strengths of Geopolymer Concrete are increased with increase in percentage of Metakaolin quantity i.e GGBS 0%-MK 100% and decreased with increase in GGBS irrespective of curing period.
- The green concrete resists the attack of various chemicals and therefore, it is durable for the given mix proportion.
- Compressive, Flexural and split tensile strengths vary in direct relation to age for a given proportion of a mix.
- Proportion C<sub>1</sub> obtained the maximum in percentage reduction of 0.73 in weight for 30 days of chemical curing (Na<sub>2</sub>SO<sub>4</sub>).
- Proportion C<sub>6</sub> obtained the maximum in percentage reduction of 15.28 in Compressive strength for 30 days of chemical curing (Na<sub>2</sub>SO<sub>4</sub>).
